1. Scope

1.1 This practice covers a method to control the removal of samples of coating films from substrates for subsequent laboratory analysis for heavy metal content on a mass basis. This technique can be used in the field, the fabricating shop, or laboratory.

1.2 The values stated in SI units are to be regarded as the standard. The values in parentheses are for information only.

1.3 This standard does not purport to address all of the safety concerns, if any, associated with its use. It is the responsibility of the user of this standard to establish appropriate safety and health practices and determine the applicability of regulatory limitations prior to use. For specific hazard information, see Section 5, Note 1 and Note 3.

2. Referenced Documents

2.1 ASTM Standards:
D 1186 Test Methods for Nondestructive Measurement of Dry Film Thickness of Nonmagnetic Coatings Applied to a Ferrous Base
D 1400 Test Method for Nondestructive Measurement of Dry Film Thickness of Nonconductive Coatings Applied to a Nonferrous Metal Base
D 4138 Test Methods for Measurement of Dry Film Thickness of Protective Coating Systems by Destructive Means

3. Significance and Use

3.1 Prior to beginning a project that involves the removal, cutting, grinding, or burning of paint, it is necessary to determine if the coating contains hazardous materials, such as lead, as certain requirements for worker and environmental protection may need to be imposed. The presence and quantity of hazardous materials in a paint can be determined through laboratory analysis; however, since the analysis is based on the weight of the specimen, the removal of the sample must be properly controlled to improve the reliability of the test results.

The number and location of samples to be removed must also be determined to characterize properly the extent of the presence of hazardous materials, if any, on a structure.

4. Materials and Equipment

4.1 Sample Collection Container—A clean plastic bag or rigid container comprised of a material such as polyethylene that will not contaminate the sample.

4.2 Straight Edge or Ruler.

4.3 Knife or Chisel, cleaned and sharpened, for removing paint samples.

4.4 Dry Film Thickness Gage, for measuring total coating thickness.

5. Procedure

5.1 Select a sufficient number of areas for coating removal that properly characterize the coatings on the structure.

5.1.1 Selection may be based on painting history, knowledge of previously applied coatings, prior touch-up and repainting programs, and other such factors.

5.1.2 Select areas that properly characterize the range of thickness found. Dry film thickness can be measured in accordance with Test Methods D 1186, D 1400, or D 4138.

5.1.3 Remove a minimum of three samples.

5.2 At each sample site, clean the surface of dirt, dust, or debris.

Note 1—Hazardous materials can be present in surface debris and chalk which may be removed during cleaning. Thus, consideration should be given to collecting this surface debris and chalk for analysis.

5.3 At each sample site, use a knife and straight edge to scribe the perimeter of a square through the coating film to the substrate. The square should be of sufficient size to give a one gram sample.

Note 2—Paint with a density of 1.5 g/cm³ and 250 microns (10 mils) thick will generate one gram of sample in a square that is 5 cm (2 in.) on a side assuming 100 percent of the material is collected. Paint density normally ranges from 1.1 to 2.5 g/cm³. Adjust the sample size based on density, thickness and collection efficiency.

5.4 Remove essentially all of the coating within the square down to the substrate by scraping, by making closely-spaced parallel scribes to disbond ribbons of the coating, or other controlled means that permit collection of all of the film
scrapings. Take extreme care to remove the coating to the substrate, but avoid including portions of the substrate itself in the sample. Place all chips and scrapings in the sample bag or container.

Note 3—The controlled application of heat to the sample area may assist in paint removal, but health and safety concerns must be carefully addressed before using such methods.

5.5 Seal the sample bag or container, tape shut to avoid accidental or unauthorized opening, and complete the information as designated in Section 6.

6. Report

6.1 Sample Containers—Report the following minimum information on each sample container:

6.1.1 Identification number (This is a unique number assigned to each sample.).
6.1.2 Date and time of sampling.
6.1.3 Project name and location.
6.1.4 Name and signature of technician removing sample.
6.1.5 Size of sample, method of removal, and film thickness.

6.2 Chain of Custody Form—Report the following minimum information:

6.2.1 Project name and location.
6.2.2 Name of technician removing sample.
6.2.3 Unique sample number, date and time of sample removal, specific location from which sample is removed, dry film thickness, and appearance and condition of substrate after removal of the sample.
6.2.4 The laboratory analysis specified for each component (for example, lead, chromium, etc., as required in the contract documents, or as agreed upon between purchaser and seller). Caution the laboratory that fragments of the substrate, if included in the sample, should be removed prior to analysis.
6.2.5 Signatures and dates for each transfer of the samples from the technician through the carrier(s) to the laboratory receiving the samples.

7. Keywords

7.1 coating film sampling; coating film identification; hazardous elements; heavy metals; paint film identification; paint film sampling; sampling

ASTM International takes no position respecting the validity of any patent rights asserted in connection with any item mentioned in this standard. Users of this standard are expressly advised that determination of the validity of any such patent rights, and the risk of infringement of such rights, are entirely their own responsibility.

This standard is subject to revision at any time by the responsible technical committee and must be reviewed every five years and if not revised, either reapproved or withdrawn. Your comments are invited either for revision of this standard or for additional standards and should be addressed to ASTM International Headquarters. Your comments will receive careful consideration at a meeting of the responsible technical committee, which you may attend. If you feel that your comments have not received a fair hearing you should make your views known to the ASTM Committee on Standards, at the address shown below.
